

What this dashboard is doing

The dashboard ranks sectors, industries, factors, themes, countries, crypto exposures, defensive assets, and large stocks using a seven-pillar methodology. The output is a decision-support label, not a guarantee. It asks: which instruments have improving momentum, trend, rotation, macro context, and money-flow confirmation?

XLE STATE

STAGE 2 BULLISH

Current cached dashboard snapshot.

S SCORE

+1.096

Composite score across the seven pillars.

F SCORE

+0.425

Institutional-flow composite.

Forecast horizons by signal

Flow	1 to 3 weeks	Confirms whether money is entering or leaving now.
RRG rotation	4 to 12 weeks	Shows whether relative strength and momentum are improving.
Stage 2 / trend	4 to 26 weeks	Identifies an established advance above a rising 30-week average.
Business-cycle tilt	3 to 6 months	Adds macro context for sector preference.

Plain-English disclaimer

Important: This report is educational decision support. It is not financial advice, not a broker recommendation, and not a promise that the forecast will be right.

Whateach pillar means and which valuesare meaningful

Momentum 12-month return excluding the most recent month. Positive and rising is constructive.	Trend filters Faber 10-month and absolute momentum gates. Above the filter is healthier than below it.
Weinstein Stage Stage 2 means price is above a rising 30-week average with positive relative strength.	Dual momentum Compares the asset against safe T-bill exposure and its own trend.
RRQ rotation Leading or Improving quadrants are constructive; Lagging is a warning.	Business-cycle tilt Macro phase can increase or reduce a sector's score.
Institutional flow CMF, OBV, ETF flow, block activity, volume, and short-interest pressure.	

Meaningful values	
S_score > 0	Better than average composite evidence inside its asset class.
S_score >= +1.0	Very strong composite reading; dashboard grade A.
S_score <= -1.5	Very weak composite reading; dashboard grade F.
F_score > 0	Flow backdrop is supportive.
F_score < -0.5 sigma	Hard flow veto; ranking is killed even if price momentum looks good.
CMF21 > +0.05	Accumulation pressure is strong enough for Stage-2 bullish gate.
Breadth >= 60%	Enough of the last 50 sessions are above their 50-day average.
Mansfield RS > 0	The instrument is outperforming the benchmark over the last year.

Macro context used in this report	
Current macro phase: MID	Benchmark above 10mo SMA; yield-curve data unavailable. (Coarse proxy)

Detailed signal rows

Pillar	Measure	Formula/input	XLE value	Threshold	Read
Momentum	12-1 momentum	close[-21] / close[-252] - 1	+39.2%	> 0% stronger when near the top of peers	Bullish XLE has a positive long-term return after skipping the latest month. 4-26 weeks
Trend filters	Faber 10-month filter	monthly close > 10-month SMA	Pass	Pass	Bullish The long-term monthly trend filter is constructive when it passes 1-6 months
Weinstein Stage	Stage and 30wMA slope	price > 30wMA and 30wMA slope > 0	Stage 2, slope +0.47	Stage 2 with positive slope	Bullish Stage 2 means price is above a rising long-term average. 4-26 weeks
Relative strength	Mansfield RS	asset/benchmark ratio change over 52 weeks	+12.71	> 0 means outperforming benchmark	Bullish Positive Mansfield RS says XLE beat the benchmark over the lookback. 4-26 weeks
Dual momentum	Antonacci absolute momentum	asset 12m return > T-bill 12m return	Pass	Pass	Bullish The asset is favored when it beats the defensive T-bill proxy. 1-6 months
RRG rotation	RRG quadrant	RS-Ratio >= 100 and RS-Momentum >= 100	Leading	Leading or Improving	Bullish RS-Ratio 106.01 and RS-Momentum 100.40 place XLE in rotation context 4-12 weeks

How to read this table

Formula/input explains the mechanical calculation. XLE value is the current cached value used by the dashboard. Threshold is the line that usually changes the interpretation. Horizon is the rough time window where the signal is most useful. A bullish row is useful only when it agrees with the other pillars; one strong row alone is not enough.

Detailed signal rows

Pillar	Measure	Formula/input	XLE value	Threshold	Read
Business cycle	Cycle tilt	sector favored in current macro phase	-1.0	+1 favored, 0 neutral, -1 unfavored	Bearish The macro phase can add or subtract a small sector preference. 3-6 months
Institutional flow	F_score	weighted z-score of CMF, OBV, ETF flow, blocks, RVOL, short interest	+0.425	> 0 supportive; < -0.5 activates veto	Bullish Positive flow supports the price trend; deeply negative flow blocks selection. 1-3 weeks
Institutional flow	CMF21	21-day Chaikin money flow	+0.254	> +0.05 confirms accumulation	Bullish CMF above +0.05 means closes are occurring high in the range on volume. 1-3 weeks
Institutional flow	OBV slope	20-day OBV regression slope / average absolute OBV	+0.0032	> 0 supports accumulation	Bullish A positive OBV slope means volume has tended to confirm upward closes 1-3 weeks
Institutional flow	RVOL	latest volume / prior 20-day average volume	1.12	> 1.0 means participation is above average	Bullish Higher relative volume says the current move has more participation. days to weeks
Risk checks	Distribution days	25-day count of weak closes on heavy volume	1	< 4 avoids warning gate	Bullish Few distribution days means there is not yet persistent heavy-volume selling. 1-5 weeks

How to read this table

Formula/input explains the mechanical calculation. XLE value is the current cached value used by the dashboard. Threshold is the line that usually changes the interpretation. Horizon is the rough time window where the signal is most useful. A bullish row is useful only when it agrees with the other pillars; one strong row alone is not enough.

What Bullish Stage 2 means

Bullish Stage 2 is the dashboard's strongest positive state. In plain English: XLE is in an established uptrend, is outperforming its benchmark, sits in the Leading RRG quadrant, has enough breadth confirmation, and has positive money-flow evidence. The expected horizon is roughly 4 to 26 weeks, but the signal still needs risk management.

XLE Stage-2 checklist			
Y	Price is above the 30-week moving average	price 59.49 vs MA52.03	price > 30w MA
Y	30-week moving average is rising	rising	slope > 0
Y	Mansfield relative strength is positive	+12.71	Mansfield RS > 0
Y	RRG quadrant is Leading	Leading	RRG = Leading
Y	Breadth is at least 60%	68%	breadth >= 60%
Y	CMF21 is above +0.05	+0.254	CMF21 > +0.05
Y	ETF flow is non-negative	+0.0%	5-day flow >= 0%
Y	Hard flow veto is not active	not active	F-score not below veto line

RANK	SELECTED	VETO	MOMENTUM
2	YES	NO	+39.2%
in US Sectors	Included by class rank.	Flow veto is not active.	12-1 momentum.

What to do / what not to assume	
Use this as a watchlist or position-management signal: compare XLE to your risk limits, stop plan, portfolio concentration, and broader market conditions.	Do not assume it means a guaranteed profit, an immediate buy at any price, or that the signal cannot reverse quickly if flow or trend breaks.

Stage 2 and selection calculation

Gate	Formula	Current	Threshold	Why it matters
Y Price vs 30wMA	price / 30wMA - 1	+14.3%	> 0%	XLE is above its long-term trend line, so the primary trend gate passes.
Y 30wMA slope	(30wMA now - 30wMA 5 weeks ago) / 5	+0.47	> 0	A rising 30-week average confirms the long-term trend is improving.
Y Mansfield RS	(XLE/SPY now) / (XLE/SPY 52 weeks ago) - 1	+12.71	> 0	Positive relative strength means XLE is outperforming the benchmark.
Y RRG quadrant	RS-Ratio and RS-Momentum quadrant	Leading	Leading	Leading means both relative strength and relative momentum are above the RRG baseline.
Y Breadth 50d	share of last 50 closes above their 50-day SMA	68%	>= 60%	The dashboard requires broad participation before using the bullish label.
Y CMF21 accumulation	21-day Chaikin money flow	+0.254	> +0.05	Positive CMF confirms buyers are controlling more of the daily range.
Y ETF 5d flow	estimated 5-day ETF net flow / AUM	+0.0%	>= 0.0%	Non-negative ETF flow avoids a negative-flow disqualification.
Y Flow veto	provider-flow z-score < -0.5	Not active	Not active	The hard veto is not active, so XLE can keep its rank and label.
Y Composite S_score	weighted methodology score	+1.096	> 0 supportive; >= +1 strong	A score above +1 means several pillars agree at the same time.
Y Class rank	rank by S_score_after_veto inside asset class	2 of top 4	<= 4	XLE remains inside the selected group for US sectors after veto checks.

Bottom line

XLE receives the Bullish Stage 2 label because the trend, relative strength, rotation, breadth, and money-flow gates pass together. If any of the strict bullish gates fails later, the label can step down to Hold, Warning, Exit, or Bearish Stage 4.

Composite S_score math

Sum of weighted contributions: +1.096

Interpreting the S_score

S_score > 0	Composite evidence is better than the peer-group average.
S_score >= +1.0	A strong reading: multiple pillars agree at the same time.
F_score < -0.5	Hard flow veto: the asset loses ranking eligibility even if price looks good.
Rank <= class target	The asset is selected only if it ranks inside the class allocation target.

Important nuance

The score math ranks XLE against peers in its asset class. A high score is not a price target. It means XLE's current evidence stack is stronger than most comparable instruments in the same dashboard universe.

Institutional-flow component detail

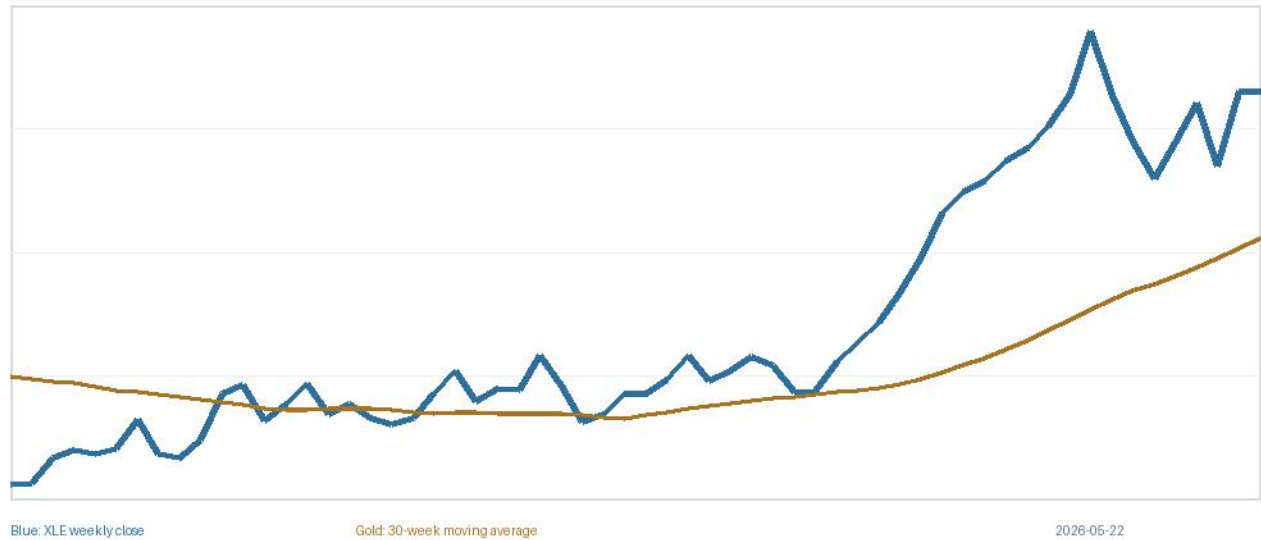

Flow interpretation

Flow is the dashboard's faster confirmation layer. It usually matters over one to three weeks, while the Stage 2 trend label can last longer. The current XLE flow stack is supportive because CMF21 is positive, the hard flow veto is not active, and the composite F_score is above zero.

What can invalidate the flow confirmation

Watch for CMF21 falling below zero, ETF flow turning meaningfully negative, a block-up ratio below 0.7, rising distribution days, or a provider-flow z-score below -0.5. Those conditions can move a strong trend from Bullish to Warning or Exit.

XLE price vs 30-week moving average

S_score composite gauge

F_score flow gauge

CMF21 accumulation gauge

Stage lifecycle

How to read the visuals

The price chart checks whether XLE is above its long-term trend line. The S-score gauge shows the combined methodology score versus peers. The F-score and CMF gauges focus on whether flow supports the price move. The lifecycle diagram shows that Stage 2 is the advancing phase, not the end of the full market cycle.
