

Dashboard Signals Report

Plain-English guide to the methodology and the XLE Stage-2 example

What this dashboard is doing

The dashboard ranks sectors, industries, factors, themes, countries, crypto exposures, defensive assets, and large stocks using a seven-pillar methodology. The output is a decision-support label, not a guarantee. It asks: which instruments have improving momentum, trend, rotation, macro context, and money-flow confirmation?

XLE STATE

STAGE 2 BULLISH

Current cached dashboard snapshot.

S SCORE

+1.096

Composite score across the seven pillars.

F SCORE

+0.425

Institutional-flow composite.

Forecast horizons by signal

Flow

1 to 3 weeks

Confirms whether money is entering or leaving now.

RRG rotation

4 to 12 weeks

Shows whether relative strength and momentum are improving.

Stage 2 / trend

4 to 26 weeks

Identifies an established advance above a rising 30-week average.

Business-cycle til

3 to 6 months

Adds macro context for sector preference.

Plain-English disclaimer

Important: This report is educational decision support. It is not financial advice, not a broker recommendation, and not a promise that the forecast will be right.

Seven Signal Pillars

What each pillar means and which values are meaningful

Momentum

12-month return excluding the most recent month. Positive and rising is constructive.

Trend filters

Faber 10-month and absolute momentum gates. Above the filter is healthier than below it.

Weinstein Stage

Stage 2 means price is above a rising 30-week average with positive relative strength.

Dual momentum

Compares the asset against safe T-bill exposure and its own trend.

RRG rotation

Leading or Improving quadrants are constructive; Lagging is a warning.

Business-cycle tilt

Macro phase can increase or reduce a sector's score.

Institutional flow

CMF, OBV, ETF flow, block activity, volume, and short-interest pressure.

Meaningful values

S_score > 0	Better than average composite evidence inside its asset class.
S_score >= +1.0	Very strong composite reading; dashboard grade A.
S_score <= -1.5	Very weak composite reading; dashboard grade F.
F_score > 0	Flow backdrop is supportive.
F_score < -0.5 sigma	Hard flow veto: ranking is killed even if price momentum looks good
CMF21 > +0.05	Accumulation pressure is strong enough for Stage-2 bullish rate
Breadth >= 60%	Enough of the last 50 sessions are above their 50-day average.
Mansfield RS > 0	The instrument is outperforming the benchmark over the last year.

Macro context used in this report

Current macro phase: MID Benchmark above 10mo SMA; yield-curve data unavailable. (Coarse proxy.)

Signal Deep Dive 1

Large-type signal cards with formulas, XLE values, thresholds, and horizons

Detailed signal cards

MOMENTUM

Bullish

12-1 momentum

XLE value

+39.2%

Formula/input

$\text{close}[-21] / \text{close}[-252] - 1$

Meaningful threshold

> 0%, stronger when near the top of peers

Interpretation

XLE has a positive long-term return after skipping the latest month.

Horizon: 4-26 weeks

TREND FILTERS

Bullish

Faber 10-month filter

XLE value

Pass

Formula/input

monthly close > 10-month SMA

Meaningful threshold

Pass

Interpretation

The long-term monthly trend filter is constructive when it passes.

Horizon: 1-6 months

WEINSTEIN STAGE

Bullish

Stage and 30wMA slope

XLE value

**Stage 2, slope
+0.47**

Formula/input

price > 30wMA and 30wMA
slope > 0

Meaningful threshold

Stage 2 with positive slope

Interpretation

Stage 2 means price is above a rising long-term average.

Horizon: 4-26 weeks

How to read these cards

XLE value is the current cached value used by the dashboard. The threshold is the line that usually changes the interpretation. A bullish row matters most when it agrees with the rest of the methodology.

Signal Deep Dive 2

Large-type signal cards with formulas, XLE values, thresholds, and horizons

Detailed signal cards

RELATIVE STRENGTH

Bullish

Mansfield RS

XLE value

+12.71

Formula/input

asset/benchmark ratio change
over 52 weeks

Meaningful threshold

> 0 means outperforming
benchmark

Interpretation

Positive Mansfield RS says XLE beat the benchmark over the
lookback.

Horizon: 4-26 weeks

DUAL MOMENTUM

Bullish

Antonacci absolute momentum

XLE value

Pass

Formula/input

asset 12m return > T-bill 12m
return

Meaningful threshold

Pass

Interpretation

The asset is favored when it beats the defensive T-bill proxy.

Horizon: 1-6 months

RRG ROTATION

Bullish

RRG quadrant

XLE value

Leading

Formula/input

RS-Ratio ≥ 100 and
RS-Momentum ≥ 100

Meaningful threshold

Leading or Improving

Interpretation

RS-Ratio 106.01 and RS-Momentum 100.40 place XLE in
rotation context.

Horizon: 4-12 weeks

Signal Deep Dive 3

Large-type signal cards with formulas, XLE values, thresholds, and horizons

Detailed signal cards

BUSINESS CYCLE

Bearish

Cycle tilt

XLE value

-1.0

Formula/input

sector favored in current macro phase

Meaningful threshold

+1 favored, 0 neutral, -1 unfavored

Interpretation The macro phase can add or subtract a small sector preference.

Horizon: 3-6 months

INSTITUTIONAL FLOW

Bullish

F_score

XLE value

+0.425

Formula/input

weighted z-score of CMF, OBV, ETF flow, blocks, RVOL, short interest

Meaningful threshold

> 0 supportive; < -0.5 activates veto

Interpretation Positive flow supports the price trend; deeply negative flow blocks selection.

Horizon: 1-3 weeks

INSTITUTIONAL FLOW

Bullish

CMF21

XLE value

+0.254

Formula/input

21-day Chaikin money flow

Meaningful threshold

> +0.05 confirms accumulation

Interpretation CMF above +0.05 means closes are occurring high in the range on volume.

Horizon: 1-3 weeks

Signal Deep Dive 4

Large-type signal cards with formulas, XLE values, thresholds, and horizons

Detailed signal cards

INSTITUTIONAL FLOW

Bullish

OBV slope

XLE value

+0.0032

Formula/input

20-day OBV regression slope /
average absolute OBV

Meaningful threshold

> 0 supports accumulation

Interpretation

A positive OBV slope means volume has tended to confirm upward closes.

Horizon: 1-3 weeks

INSTITUTIONAL FLOW

Bullish

RVOL

XLE value

1.12

Formula/input

latest volume / prior 20-day
average volume

Meaningful threshold

> 1.0 means participation is
above average

Interpretation

Higher relative volume says the current move has more participation.

Horizon: days to weeks

RISK CHECKS

Bullish

Distribution days

XLE value

1

Formula/input

25-day count of weak closes on
heavy volume

Meaningful threshold

< 4 avoids warning gate

Interpretation

Few distribution days means there is not yet persistent heavy-volume selling.

Horizon: 1-5 weeks

What Bullish Stage 2 means

Bullish Stage 2 is the dashboard's strongest positive state. In plain English: XLE is in an established uptrend, is outperforming its benchmark, sits in the Leading RRG quadrant, has enough breadth confirmation, and has positive money-flow evidence. The expected horizon is roughly 4 to 26 weeks, but the signal still needs risk management.

XLE Stage-2 checklist		
Y Price is above the 30-week moving average	price 59.49 vs MA 52.03	price > 30w MA
Y 30-week moving average is rising	rising	slope > 0
Y Mansfield relative strength is positive	+12.71	Mansfield RS > 0
Y RRG quadrant is Leading	Leading	RRG = Leading
Y Breadth is at least 60%	68%	breadth >= 60%
Y CMF21 is above +0.05	+0.254	CMF21 > +0.05
Y ETF flow is non-negative	+0.0%	5-day flow >= 0%
Y Hard flow veto is not active	not active	F-score not below veto line

RANK

2

in US Sectors

SELECTED

YES

Included by class rank.

VETO

NO

Flow veto is not active.

MOMENTUM

+39.2%

12-1 momentum.

What to do / what not to assume

Use this as a watchlist or position-management signal: compare XLE to your risk limits, stop plan, portfolio concentration, and broader market conditions.

Do not assume it means a guaranteed profit, an immediate buy at any price, or that the signal cannot reverse quickly if flow or trend breaks.

XLE Calculation Trail

Gate details 1: readable step-by-step calculations

Stage 2 and selection calculation

Y Price vs 30wMA

+14.3%

Formula

price / 30wMA - 1

Threshold

> 0%

Why it matters

XLE is above its long-term trend line, so the primary trend gate passes.

Y 30wMA slope

+0.47

Formula

(30wMA now - 30wMA 5 weeks ago) / 5

Threshold

> 0

Why it matters

A rising 30-week average confirms the long-term trend is improving.

Y Mansfield RS

+12.71

Formula

(XLE/SPY now) / (XLE/SPY 52 weeks ago) - 1

Threshold

> 0

Why it matters

Positive relative strength means XLE is outperforming the benchmark.

Y RRG quadrant

Leading

Formula

RS-Ratio and RS-Momentum quadrant

Threshold

Leading

Why it matters

Leading means both relative strength and relative momentum are above the RRG baseline.

XLE Calculation Trail

Gate details 2: readable step-by-step calculations

Stage 2 and selection calculation

Y Breadth 50d

68%

Formula

share of last 50 closes above their 50-day
SMA

Threshold

$\geq 60\%$

Why it matters

The dashboard requires broad participation before using the bullish label.

Y CMF21 accumulation

+0.254

Formula

21-day Chaikin money flow

Threshold

$> +0.05$

Why it matters

Positive CMF confirms buyers are controlling more of the daily range.

Y ETF 5d flow

+0.0%

Formula

estimated 5-day ETF net flow / AUM

Threshold

$\geq 0.0\%$

Why it matters

Non-negative ETF flow avoids a negative-flow disqualification.

Y Flow veto

Not active

Formula

provider-flow z-score < -0.5

Threshold

Not active

Why it matters

The hard veto is not active, so XLE can keep its rank and label.

Stage 2 and selection calculation

Y Composite S_score	+1.096
Formula weighted methodology score	Threshold > 0 supportive; >= +1 strong
	Why it matters A score above +1 means several pillars agree at the same time.

Y Class rank	2 of top 4
Formula rank by S_score_after_veto inside asset class	Threshold <= 4
	Why it matters XLE remains inside the selected group for US sectors after veto checks.

Bottom line

XLE receives the Bullish Stage 2 label because the trend, relative strength, rotation, breadth, and money-flow gates pass together. If any strict bullish gate fails later, the label can step down to Hold, Warning, Exit, or Bearish Stage 4.

XLE Score Math

Reading The S_score

What the composite number does and does not mean

Interpreting the S_score

S_score > 0	Composite evidence is better than the peer-group average.
S_score >= +1.0	A strong reading: multiple pillars agree at the same time.
F_score < -0.5	Hard flow veto: the asset loses ranking eligibility even if price looks good.
Rank <= class target	The asset is selected only if it ranks inside the class allocation target.

Important nuance

The score math ranks XLE against peers in its asset class. A high score is not a price target. It means XLE's current evidence stack is stronger than most comparable instruments in the same dashboard universe.

Institutional-flow component detail

Institutional-flow component detail

Flow Interpretation

How the fast money-flow layer can confirm or weaken Stage 2

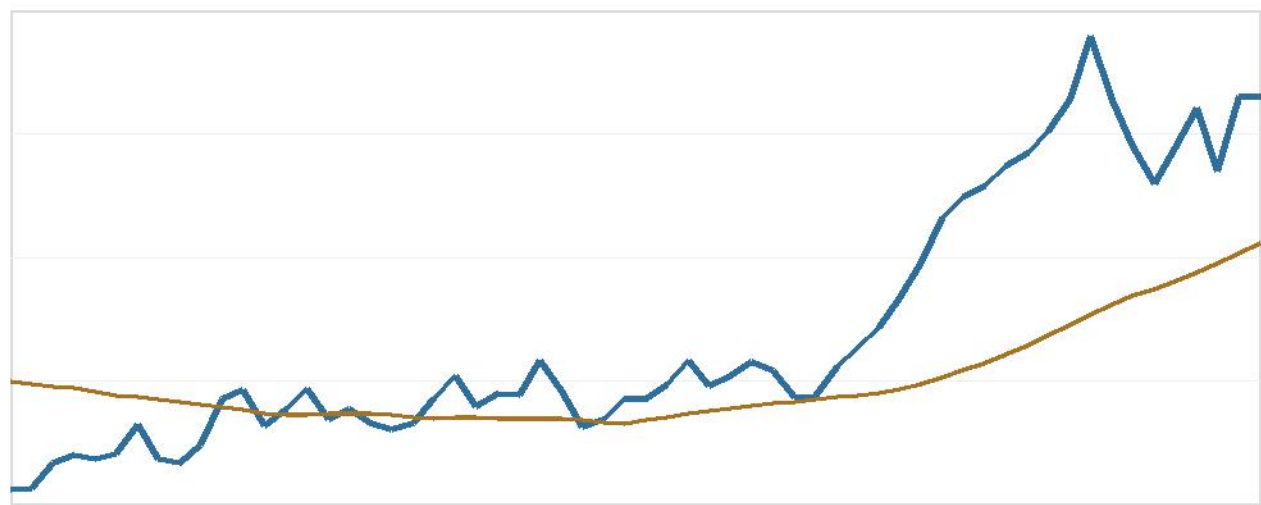

Flow interpretation

Flow is the dashboard's faster confirmation layer. It usually matters over one to three weeks, while the Stage 2 trend label can last longer. The current XLE flow stack is supportive because CMF21 is positive, the hard flow veto is not active, and the composite F_score is above zero.

What can invalidate the flow confirmation

Watch for CMF21 falling below zero, ETF flow turning meaningfully negative, a block-up ratio below 0.7, rising distribution days, or a provider-flow z-score below -0.5. Those conditions can move a strong trend from Bullish to Warning or Exit.

XLE price vs 30-week moving average

Blue: XLE weekly close Gold: 30-week moving average 2026-05-22

S_score composite gauge

value: +1.096

F_score flow gauge

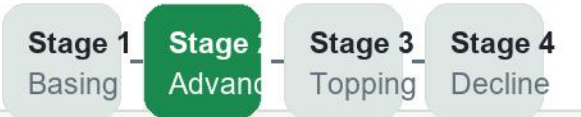

value: +0.425

CMF21 accumulation gauge

value: +0.254

Stage lifecycle

How to read the visuals

The price chart checks whether XLE is above its long-term trend line. The S-score gauge shows the combined methodology score versus peers. The F-score and CMF gauges focus on whether flow supports the price move. The lifecycle diagram shows that Stage 2 is the advancing phase, not the end of the full market cycle.
